

REACTIVE PROGRAMMING & UNDERSTANDING UI

OUTLINE

- Reactive Programming Part 1
 - Reactivity 101
 - Reactive objects
 - Reactive sources and endpoints
 - Reactive conductors
 - Implementation
 - Observers and side effects
 - Render functions
- Understanding UI
 - Ladder of Progression
 - High Level View
 - Shiny built-ins
 - External packages
 - HTML Tools
 - RAW HTML

REACTIVE PROGRAMMING

PART 1

Reactivity

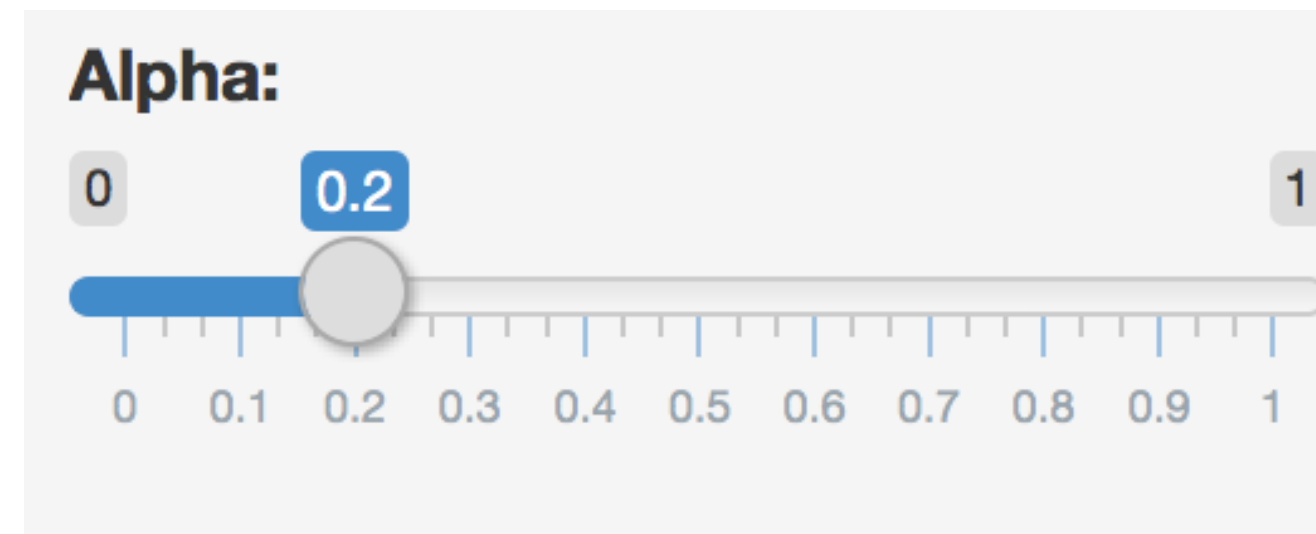

101

REACTIONS

The **input\$** list stores the current value of each input object under its name.

```
# Set alpha level  
sliderInput(inputId = "alpha",  
  label = "Alpha:",  
  min = 0, max = 1,  
  value = 0.5)
```

input\$alpha

input\$alpha = 0.2

input\$alpha = 0.5

input\$alpha = 0.8

REACTIVITY 101

Reactivity automatically occurs when an input value is used to render an output object

```
# Define server function required to create the scatterplot
server <- function(input, output) {
  # Create the scatterplot object the plotOutput function is expecting
  output$scatterplot <- renderPlot(
    ggplot(data = movies, aes_string(x = input$x, y = input$y,
                                     color = input$z)) +
    geom_point(alpha = input$alpha)
  )
}
```

EXERCISE

- ▶ Go back to the app you built last class earlier
- ▶ Add a new sliderInput defining the size of points (ranging from 0 to 5)
- ▶ Use this variable in the geom of the ggplot function as the size argument
- ▶ Run the app to ensure that point sizes react when you move the slider
- ▶ Compare your code / output with the person sitting next to / nearby you

3_m 00_s

SOLUTION

Solution to the previous exercise

`movies_06.R`

Reactive objects

TYPES OF REACTIVE OBJECTS

Reactive source

Reactive conductor

Reactive endpoint

Reactive sources and endpoints

SOURCES AND ENDPOINTS

- ▶ **Reactive source:** Typically, this is user input that comes through a browser interface
- ▶ **Reactive endpoint:** Something that appears in the user's browser window, such as a plot or a table of values

- ▶ This is the built-in reactivity discussed in the previous section
- ▶ A reactive source can be connected to multiple endpoints, and vice versa

Reactive conductors

CONDUCTORS

- ▶ **Reactive conductor:** Reactive component between a source and an endpoint
- ▶ A conductor can both be a dependent (child) and have dependents (parent)
 - ▶ Sources can only be parents (they can have dependents)
 - ▶ Endpoints can only be children (they can be dependents)

Suppose you want the option to plot only certain types of movies as well as report how many such movies are plotted:

1. Add a UI element for the user to select which type(s) of movies they want to plot
2. Filter for chosen title type and save as a new (reactive) expression
3. Use new data frame (which is reactive) for plotting
4. Use new data frame (which is reactive) also for reporting number of observations

1. Add a UI element for the user to select which type(s) of movies they want to plot

```
# Select which types of movies to plot
checkboxGroupInput(inputId = "selected_type",
  label = "Select movie type(s):",
  choices = c("Documentary", "Feature Film", "TV Movie"),
  selected = "Feature Film")
```

2. Filter for chosen title type and save the new data frame as a reactive expression

before app:

```
library(dplyr)
```

server:

```
# Create a subset of data filtering for chosen title types
movies_subset <- reactive({
  req(input$selected_type)
  filter(movies, title_type %in% input$selected_type)
})
```

Creates a **cached expression** that knows it is out of date when input changes

3. Use new data frame (which is reactive) for plotting

```
# Create the scatterplot object the plotOutput function is expecting
output$scatterplot <- renderPlot({
  ggplot(data = movies_subset(), aes_string(x = input$x, y = input$y,
                                             color = input$z)) +
    geom_point(...) +
    ...
})
```

Cached - only re-run when
inputs change

4. Use new data frame (which is reactive) also for printing number of observations

ui:

```
mainPanel(  
  ...  
  # Print number of obs plotted  
  uiOutput(outputId = "n"),  
  ...  
)
```

server:

```
# Print number of movies plotted  
output$n <- renderUI({  
  types <- movies_subset()$title_type %>%  
    factor(levels = input$selected_type)  
  counts <- table(types)  
  
  HTML(paste("There are",  
    counts,  
    input$selected_type,  
    "movies in this dataset.  
    <br>"))  
})
```

DEMO

Putting it all together...

`movies_07.R`

(also notice the HTML tags,
added for visual separation, in the mainPanel)

WHEN TO USE REACTIVES

- ▶ By using a reactive expression for the subsetting data frame, we were able to get away with subsetting once and then using the result twice
- ▶ In general, reactive conductors let you
 - ▶ not repeat yourself (i.e. avoid copy-and-paste code) which is a maintenance boon)
 - ▶ decompose large, complex (code-wise, not necessarily CPU-wise) calculations into smaller pieces to make them more understandable
- ▶ These benefits are similar to what happens when you decompose a large complex R script into a series of small functions that build on each other

EXERCISE

- ▶ For consistency, in `movies_07.R`, there should be at least one more spot on the app where the new `movies_subset` dataset should be used, instead of the full `movies` dataset
 - ▶ *Hint:* Does the data table match the plotted data?
- ▶ Find and fix
- ▶ Run the app to confirm your fix is working
- ▶ Compare your code / output with the person sitting next to / nearby you

3_m 00_s

SOLUTION

Solution to the previous exercise

`movies_08.R`

EXERCISE

Suppose we want to plot only a random sample of movies, of size determined by the user. What is wrong with the following?

ui:

```
# Select sample size
numericInput("n_samp", "Sample size:", min = 1, max = nrow(movies), value = nrow(movies))
```

server:

```
# Create a new data frame that is a sample of n_samp observations from movies
movies_sample <- sample_n(movies, input$n_samp)

# Plot the sampled movies
output$scatterplot <- ggplot(data = movies_sample,
                             aes_string(x = input$x, y = input$y, color = input$z)) +
  geom_point(...)
```

1_m 00_s

SOLUTION

Solution can also be found in movies_09.R.

Note that output\$n and output\$datatable are also updated in the script.

ui:

```
# Select sample size
numericInput("n_samp", "Sample size:", min = 1, max = nrow(movies), value = 50)
```

server:

```
# Create a new data frame that is n_samp observations from selected type movies
movies_sample <- reactive({
  req(input$n_samp) # ensure availability of value before proceeding
  sample_n(movies_subset(), input$n_samp)
})

# Plot the sampled movies
output$scatterplot <- renderPlot({
  ggplot(data = movies_sample(), aes_string(x = input$x, y = input$y, color = input$z)) +
    geom_point(...)
})
```

Implementation

IMPLEMENTATION OF REACTIVE OBJECTS

- ▶ **Reactive values – reactiveValues():** implementation of reactive sources
 - ▶ e.g. input object is a reactive value, which looks like a list, and contains many individual reactive values that are set by input from the web browser
- ▶ **Reactive expressions – reactive():** implementation of reactive conductors
 - ▶ Can access reactive values or other reactive expressions, and they return a value
 - ▶ Useful for caching the results of any procedure that happens in response to user input
 - ▶ e.g. reactive data frame subsets we created earlier
- ▶ **Observers – observe():** implementation of reactive endpoints
 - ▶ Can access reactive sources and reactive expressions, but they don't return a value; they are used for their **side effects**
 - ▶ e.g. output object is a reactive observer, which also looks like a list, and contains many individual reactive observers that are created by using reactive values and expressions in reactive functions

REACTIVITY ONLY WORKS WITH REACTIVE OBJECTS

- ▶ Only reactive primitives (like the ones on the previous slide) and things built on top of reactive primitives, will elicit reactivity. In particular, do NOT expect changes to "normal" variables to cause reactivity.

```
x <- 10  
y <- reactive({ x })  
  
# Much later...  
x <- 20
```

REACTIVE VALUES

- ▶ Like an R environment object (or what other languages call a hash table or dictionary), but reactive
- ▶ Like the `input` object, but not read-only

```
rv <- reactiveValues(x = 10)  
rv$x <- 20  
rv$y <- mtcars
```

REACTIVE VALUES

- ▶ Reading a value from a `reactiveValues` object is a reactive operation.
 - ▶ The act of reading it means the current reactive conductor or endpoint will be notified the next time the value changes.
- ▶ Maybe surprisingly, setting/updating a value on a `reactiveValues` object is *not* in itself a reactive operation, meaning no relationship is established between the current reactive conductor or endpoint (if any!) and the `reactiveValues` object.

Observers and side effects

EXERCISE

Suppose we want the user to provide a title for the plot. What is wrong with the following, and how would you fix it? See `movies_10.R`.

ui:

```
textInput(inputId = "plot_title",  
  label = "Plot title",  
  placeholder = "Enter text to be used as plot title"),
```

server:

```
output$pretty_plot_title <- toTitleCase(input$plot_title)  
output$scatterplot <- renderPlot({  
  ggplot(data = movies_sample(), aes_string(x = input$x, y = input$y, color = input$z)) +  
    geom_point(alpha = input$alpha, size = input$size) +  
    labs(title = output$pretty_plot_title)  
})
```

3_m 00_s

SOLUTION

Observers do not have dependencies, use reactivities instead.
Solution can also be found in movies_11.R.

ui:

```
textInput(inputId = "plot_title",  
  label = "Plot title",  
  placeholder = "Enter text to be used as plot title"),
```

server:

```
pretty_plot_title <- reactive({ toTitleCase(input$plot_title) })  
  
output$scatterplot <- renderPlot({  
  ggplot(data = movies_sample(), aes_string(x = input$x, y = input$y, color = input$z)) +  
    geom_point(alpha = input$alpha, size = input$size) +  
    labs(title = pretty_plot_title())  
})
```

REACTIVE EXPRESSIONS VS. OBSERVERS

- ▶ Similarities: Both store expressions that can be executed
- ▶ Differences:
 - ▶ Reactive expressions return values, but observers don't
 - ▶ Observers (and endpoints in general) *eagerly* respond to reactivities, but reactive expressions (and conductors in general) do not
 - ▶ Reactive expressions must not have *side effects*, while observers are *only* useful for their side effects

We cheated earlier, let's make it right with an observer!

See `movies_12.R`.

```
server <- function(input, output, session) {  
  ...  
  # Update the maximum allowed n_samp for selected type movies  
  observe({  
    updateNumericInput(session, inputId = "n_samp",  
                        value = nrow(movies_subset())  
    )  
  })  
  ...  
}
```

Render
functions

RENDER FUNCTIONS

```
render*({ [code_chunk] })
```

- ▶ Provide a code chunk that describes how an output should be populated
- ▶ The output will update in response to changes in any reactive values or reactive expressions that are used in the code chunk

LIST OF REACTIVE FUNCTIONS

DT::renderDataTable(expr,
options, callback, escape,
env, quoted)

dataTableOutput(outputId, icon, ...)

renderImage(expr, env, quoted, deleteFile)

imageOutput(outputId, width, height, click,
dblclick, hover, hoverDelay, hoverDelayType,
brush, clickId, hoverId, inline)

renderPlot(expr, width, height, res, ..., env,
quoted, func)

plotOutput(outputId, width, height, click,
dblclick, hover, hoverDelay, hoverDelayType,
brush, clickId, hoverId, inline)

'data.frame': 3 obs. of 2 variables:
 \$ Sepal.Length: num 5.1 4.9 4.7
 \$ Sepal.Width : num 3.5 3 3.2

renderPrint(expr, env, quoted, func,
width)

verbatimTextOutput(outputId)

	Sepal.Length	Sepal.Width	Petal.Length	Petal.Width	Species
1	5.10	3.50	1.40	0.20	setosa
2	4.90	3.00	1.40	0.20	setosa
3	4.70	3.20	1.30	0.20	setosa
4	4.60	3.10	1.30	0.20	setosa
5	5.00	3.40	1.40	0.20	setosa
6	5.40	3.60	1.70	0.40	setosa

renderTable(expr,..., env, quoted, func)

tableOutput(outputId)

foo

renderText(expr, env, quoted, func)

textOutput(outputId, container, inline)

renderUI(expr, env, quoted, func)

uiOutput(outputId, inline, container, ...)
& **htmlOutput**(outputId, inline, container, ...)

RECAP

```
render*({ [code_chunk] })
```

- ▶ These functions make objects to display
- ▶ Results should always be saved to output\$
- ▶ They make an observer object that has a block of code associated with it
- ▶ The object will rerun the entire code block to update itself whenever it is invalidated

EXERCISE

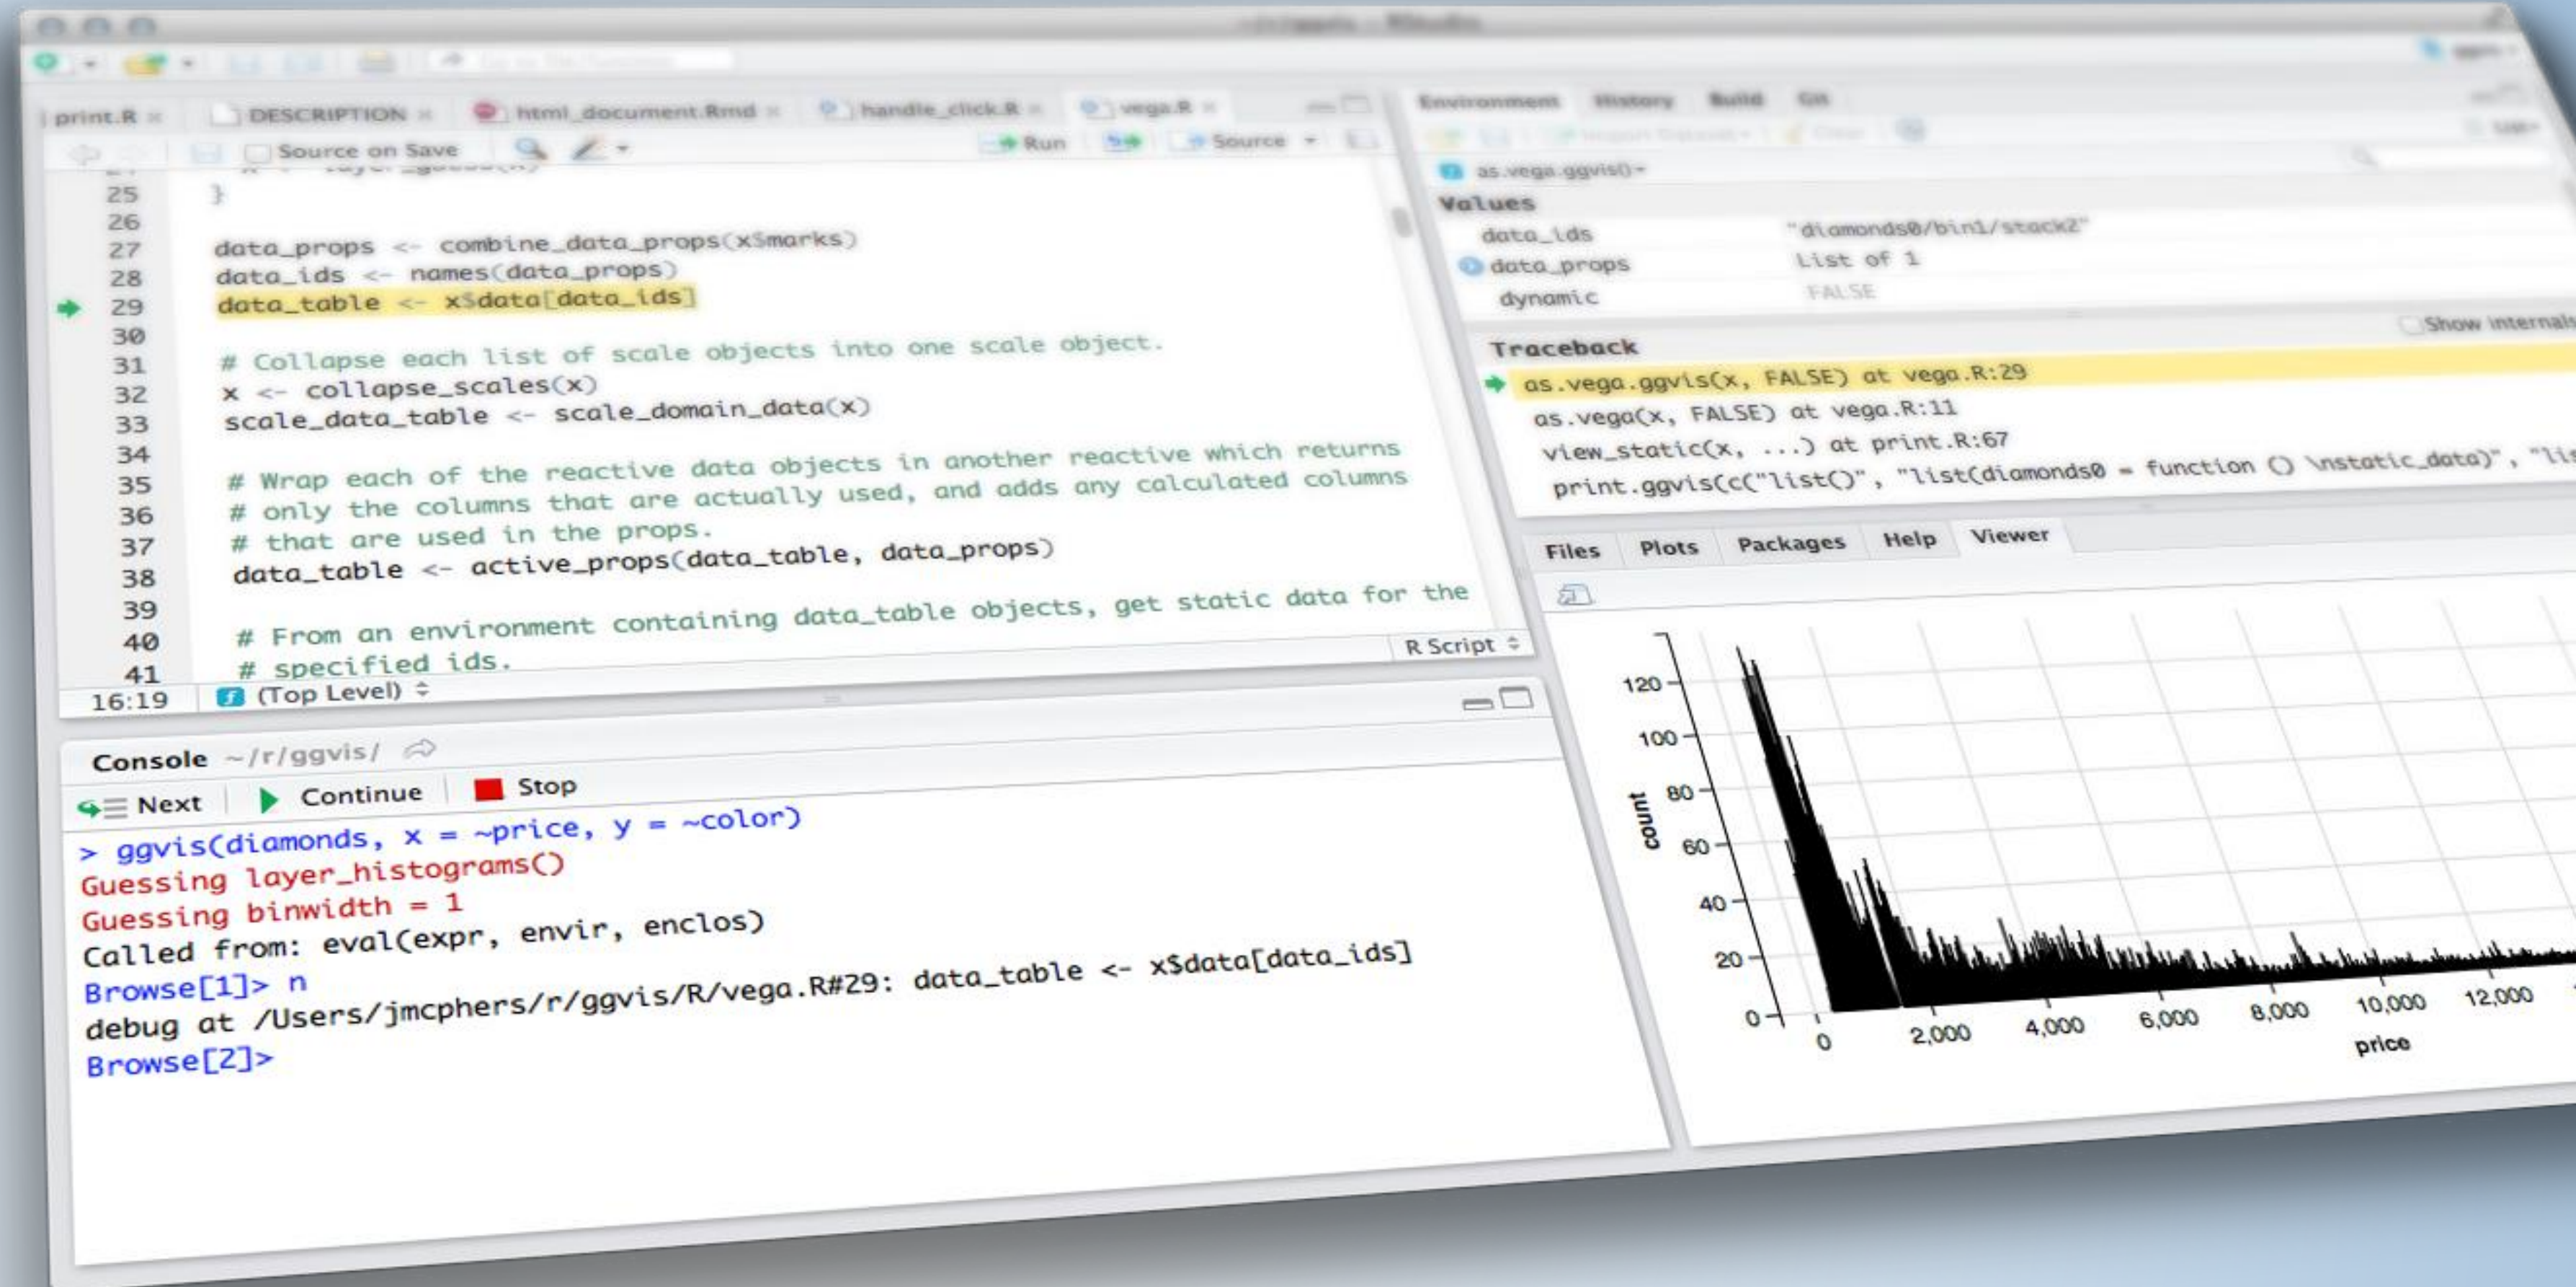

- ▶ Run the app in `movies_12.R`.
- ▶ Try entering a few different plot titles and observe that the plot title updates however the sampled data that is being plotted does not.
- ▶ Given that the `renderPlot()` function reruns each time `input$plot_title` changes, why does the sample stay the same?

1_m 00_s

SOLUTION

Because the data frame that is used in the plot is defined as a reactive expression with a code chunk that does not depend on `input$plot_title`.

CLASS BREAK

UNDERSTANDING UI

Web application UI is ultimately HTML/CSS/JavaScript

Shiny allows R users write user interfaces using a simple, familiar-looking API...

...but no limits for advanced users

Ladder of progression

LADDER OF UI PROGRESSION

Step 1. Shiny built-in inputs/outputs and layouts (sidebarLayout, navbarPage, tabsetPanel)

Step 2. Use functions from external packages (shinythemes, shinydashboard, shinybs)

Step 3. Use tag objects, write UI functions

Our focus today

Step 4. Author HTML templates

Step 5. Create custom inputs/outputs, wrap existing CSS/JS libraries and frameworks

High level
view

MULTIPLE LEVELS OF ABSTRACTION

High-level funcs

`fluidRow(...)`

htmltools tags

`div(class="row", ...)`

Raw HTML markup

`<div class="row">...</div>`

MIX AND MATCH FREELY

RAW HTML

Pros

Can do anything that's possible in a web page

Comfortable for designers, web developers

Cons

Unfamiliar for many R users

Potentially lots of HTML needed for conceptually simple tasks

CSS/JavaScript dependencies must be handled manually

```
<nav class="navbar navbar-default navbar-static-top" ro
  <div class="container">
    <div class="navbar-header">
      <span class="navbar-brand">Superzip</span>
    </div>
    <ul class="nav navbar-nav shiny-tab-input" id="nav"
      <li class="active">
        <a href="#tab-5158-1" data-toggle="tab" data-va
      </li>
      <li>
        <a href="#tab-5158-2" data-toggle="tab" data-va
      </li>
      <li>
        <a href="#tab-5158-3" data-toggle="tab"></a>
      </li>
    </ul>
  </div>
</nav>
<div class="container-fluid">
  <div class="tab-content">
    <div class="tab-pane active" data-value="Interactiv
      <div class="outer">
        <div id="map" style="width:100%; height:100%; "
        <div class="panel panel-default draggable" id="
```

HTMLTOOLS OBJECTS

HTML-generating R functions

Pros

- All the power of HTML, but looks like R
- Automated CSS/JS dependency handling
- More composable, programmable than HTML

Cons

- Easy to misplace commas
- Almost as verbose as raw HTML

```
nav(class="navbar navbar-default navbar-static-top", rol
  div(class="container",
    div(class="navbar-header",
      span(class="navbar-brand", "Superzip")
    ),
    ul(class="nav navbar-nav shiny-tab-input", id="nav",
      li(class="active",
        a(href="#tab-5158-1", `data-toggle`="tab", `data
      ),
      li(
        a(href="#tab-5158-2", `data-toggle`="tab", `data
      ),
      li(
        a(href="#tab-5158-3", `data-toggle`="tab")
      )
    )
  )
)
```

HIGH LEVEL FUNCTIONS

Functions that return htmltools objects

Pros

- Less code, clearer intent
- Anyone can make their own

Cons

- Still have to watch out for commas
- Less flexible

```
navbarPage("Superzip", id = "nav",  
  tabPanel("Interactive map", ...),  
  tabPanel("Data explorer", ...)  
)
```

Using Shiny built-ins

SHINY UI BUILT-INS

Bootstrap grid framework – fluidPage, fixedPage, fluidRow, column

Containers – wellPanel, absolutePanel, fixedPanel

Navigation panels – tabsetPanel, navlistPanel, navbarPage

Fill layouts (Shiny 0.13+) – fillPage, fillRow, fillCol

Modals and notifications (Shiny 0.14+) – showModal, modalDialog

BOOTSTRAP GRID FRAMEWORK

Every page has 12 invisible columns

Each column of content must span an integral number of columns

Simple R API for implementing Bootstrap grid

`fluidPage(...)` wraps the entire page

`fluidRow(...)` wraps each row's column

`column(width, ...)` wraps each column's content

FLUID PAGE

```
ui <- fluidPage(  
  fluidRow(  
    column(8, item1),  
    column(4, item2, item3),  
  ),  
  fluidRow(  
    column(3, item4),  
    column(3, item5),  
    column(3, item6),  
    column(3, item7)  
  )  
)
```

EXERCISE

- ▶ Modify `ui_01.R` to display the two outputs next to each other (instead of above and below)
- ▶ Assign the left output to be 5 columns wide, and the right output to be 7 columns wide
- ▶ See what happens as you change the width of the browser window

EXTERNAL PACKAGES

shinydashboard

shinythemes

The image displays a collage of Shiny dashboard examples. The background is a dark-themed dashboard with a sidebar containing 'Darkly' and 'United' theme selectors. Overlaid on this are three smaller dashboard windows. The top window uses the 'Flatly' theme and features a 'Navbar 1' with tabs 'Tab 1', 'Tab 2', and 'Tab 3'. It includes a 'Table' with columns 'speed' and 'dist', a 'Verbatim text output' box showing 'general, 30, NULL', and a series of headers from 'Header 1' to 'Header 5'. The middle window uses the 'United' theme and shows a 'File input' with 'Browse...' and 'No file se' buttons, a 'Text input' with the value 'general', a 'Slider input' with a value of 30, and a 'Default actionButton' with a 'Search' button. The bottom window uses the 'Darkly' theme and shows a 'File input' with 'Browse...' and 'No file se' buttons, a 'Text input' with the value 'general', a 'Slider input' with a value of 30, and a 'Default actionButton' with a 'Search' button. It also shows a 'Default actionButton with CSS class' with an 'Action button'.

EXTERNAL PACKAGES

shinyjs
(@daattali)

Perform many
UI-related
JavaScript
operations
from R

Function	Description
<code>show / hide / toggle</code>	Display or hide an element (optionally with an animation).
<code>hidden</code>	Initialize a Shiny tag as invisible (can be shown later with a call to <code>show</code>).
<code>enable / disable / toggleState</code>	Enable or disable an input element, such as a button or a text input.
<code>disabled</code>	Initialize a Shiny input as disabled.
<code>reset</code>	Reset a Shiny input widget back to its original value.
<code>delay</code>	Execute R code (including any <code>shinyjs</code> functions) after a specified amount of time.
<code>alert</code>	Show a message to the
<code>html</code>	Change the text/HTML of an element.
<code>onclick</code>	Run R code when a specific element is clicked. Was originally developed with the sole purpose of running a <code>shinyjs</code> function when an element is clicked, though any R code can be used.
<code>onevent</code>	Similar to <code>onclick</code> , but can be used with many other events instead of click (for example, listen for a key press, mouse hover, etc).
<code>addClass / removeClass / toggleClass</code>	add or remove a CSS class from an element.
<code>runjs</code>	Run arbitrary JavaScript code.
<code>extendShinyjs</code>	Allows you to write your own JavaScript functions and use <code>shinyjs</code> to call them as if they were regular R code. More information is available in the section "Calling your own JavaScript functions from R" below.

EXERCISE

- ▶ Modify movies_12.R to use a Bootstrap theme
 - ▶ Use the "Live theme selector" feature in shinythemes in your own app
 - ▶ Once you've decided on a theme, remove the theme selector and apply your chosen theme permanently
- ▶ See shinythemes instructions at:
<https://rstudio.github.io/shinythemes/>

5_m 00_s

SOLUTION

Solution to the previous exercise

`movies_13.R`

Using htmltools
tag objects

AN API FOR COMPOSING HTML

When Shiny was born, it came with a sub-package for composing HTML

These functions were so useful, we extracted them out into a separate package: `htmltools`

Now used by R Markdown and `htmlwidgets` as well

HTML BASICS

```
<a href="https://www.rstudio.com">RStudio</a>
```

RStudio

HTML BASICS

```
<a href="https://www.rstudio.com">RStudio</a>
```

End tag

Start tag

Child content

Attribute name

ANATOMY OF A TAG

```
<a href="https://www.rstudio.com">RStudio</a>
```

Tag name

Attribute value

Creates an **anchor** whose
hyperlink reference is the URL
`https://www.rstudio.com`

ANATOMY OF A TAG

Text can contain tags

Tags can optionally contain text and/or other tags

Each start tag can have zero or more attributes

HTML TO BROWSER UI

```
<div class="panel panel-default">  
  <div class="panel-heading">  
    <h3 class="panel-title">Panel title</h3>  
  </div>  
  <div class="panel-body">  
    Panel content  
  </div>  
</div>
```

Panel title

Panel content

LOOKS LIKE R, MEANS HTML

```
<div class="panel panel-default">  
  <div class="panel-heading">  
    <h3 class="panel-title">  
      Panel title  
    </h3>  
  </div>  
  <div class="panel-body">  
    Panel content  
  </div>  
</div>
```

```
div(class="panel panel-default",  
  div(class="panel-heading",  
    h3(class="panel-title",  
      "Panel title",  
    )  
  ),  
  div(class="panel-body",  
    "Panel content"  
  )  
)
```

USING TAG FUNCTIONS

Many common tags are exported as functions by `htmltools` and `shiny` (`p`, `h1-h6`, `a`, `br`, `div`, `span`, `img`)

All other tags can be accessed via the `tags` object. E.g., `Item 1` → `tags$li("Item 1")`

If you have lots of HTML to write, you can use the `withTags` function—it makes the `tags$` prefix optional.

```
withTags(  
  ul(  
    li("Item 1"), li("Item 2")  
  )  
)
```

USING TAG FUNCTIONS

All tag functions behave the same way

Call the function to create a tag object

Named arguments become attributes

Unnamed arguments become children

TAG ATTRIBUTES

Any valid HTML attribute name can be used (use quotes if the name has dashes, e.g. "data-toggle"="dropdown")

Valid tag attribute values are:

NULL (omit the attribute)

NA (the attribute should be included with no value)

Single-element character vector (or something to be coerced to character)

```
tags$input(type = "checkbox",  
  disabled = if (disabled) NA # else NULL  
)
```

TAG CHILDREN

Valid tag children are:

Tag objects

Single-element character vectors (treated as text)

NULL (silently ignored)

Raw HTML (see `?htmltools::HTML`)

Lists of valid tag children (recursive!)

USING TAGS

Tags are made using normal R functions that take normal parameters and return normal values! You can do R-like things to them:

```
tags$ul(lapply(1:10, tags$li))
```

Print tag objects at the console to see their HTML source

Call `print(x, browse = TRUE)` to see their rendered view instead

Use `htmltools::browsable()` to make an object show its rendered view when printed, by default

If your top-level object is a list, you'll need to wrap in `tagList(...)` to get the right behavior at the console (or in an R Markdown doc)

EXERCISE

- ▶ Open `ui_03.R`.
- ▶ Replace `includeHTML("youtube_thumbnail.html")` with the equivalent `htmltools` tag objects.
 - ▶ Hint: Take a look inside `youtube_thumbnail.html`.
- ▶ If you get that working, take the next step and define an R function that takes a YouTube URL, a title, and a description, and returns a thumbnail frame like the one you created.

SOLUTION

Solutions to the previous exercise

ui_04.R

ui_05.R

Using

raw HTML

USING RAW HTML

Incorporate tiny amounts of HTML using inline string literals wrapped in `HTML()`

```
div(HTML("This is <strong>HTML</strong>"))
```

For chunks of (static) HTML, use `includeHTML` (or similar `includeCSS`, `includeScript`)

```
div(includeHTML("file.html"))
```

Or go the other way, with the [HTML Templates](#) feature: start with HTML, and embed R expressions that yield tag objects

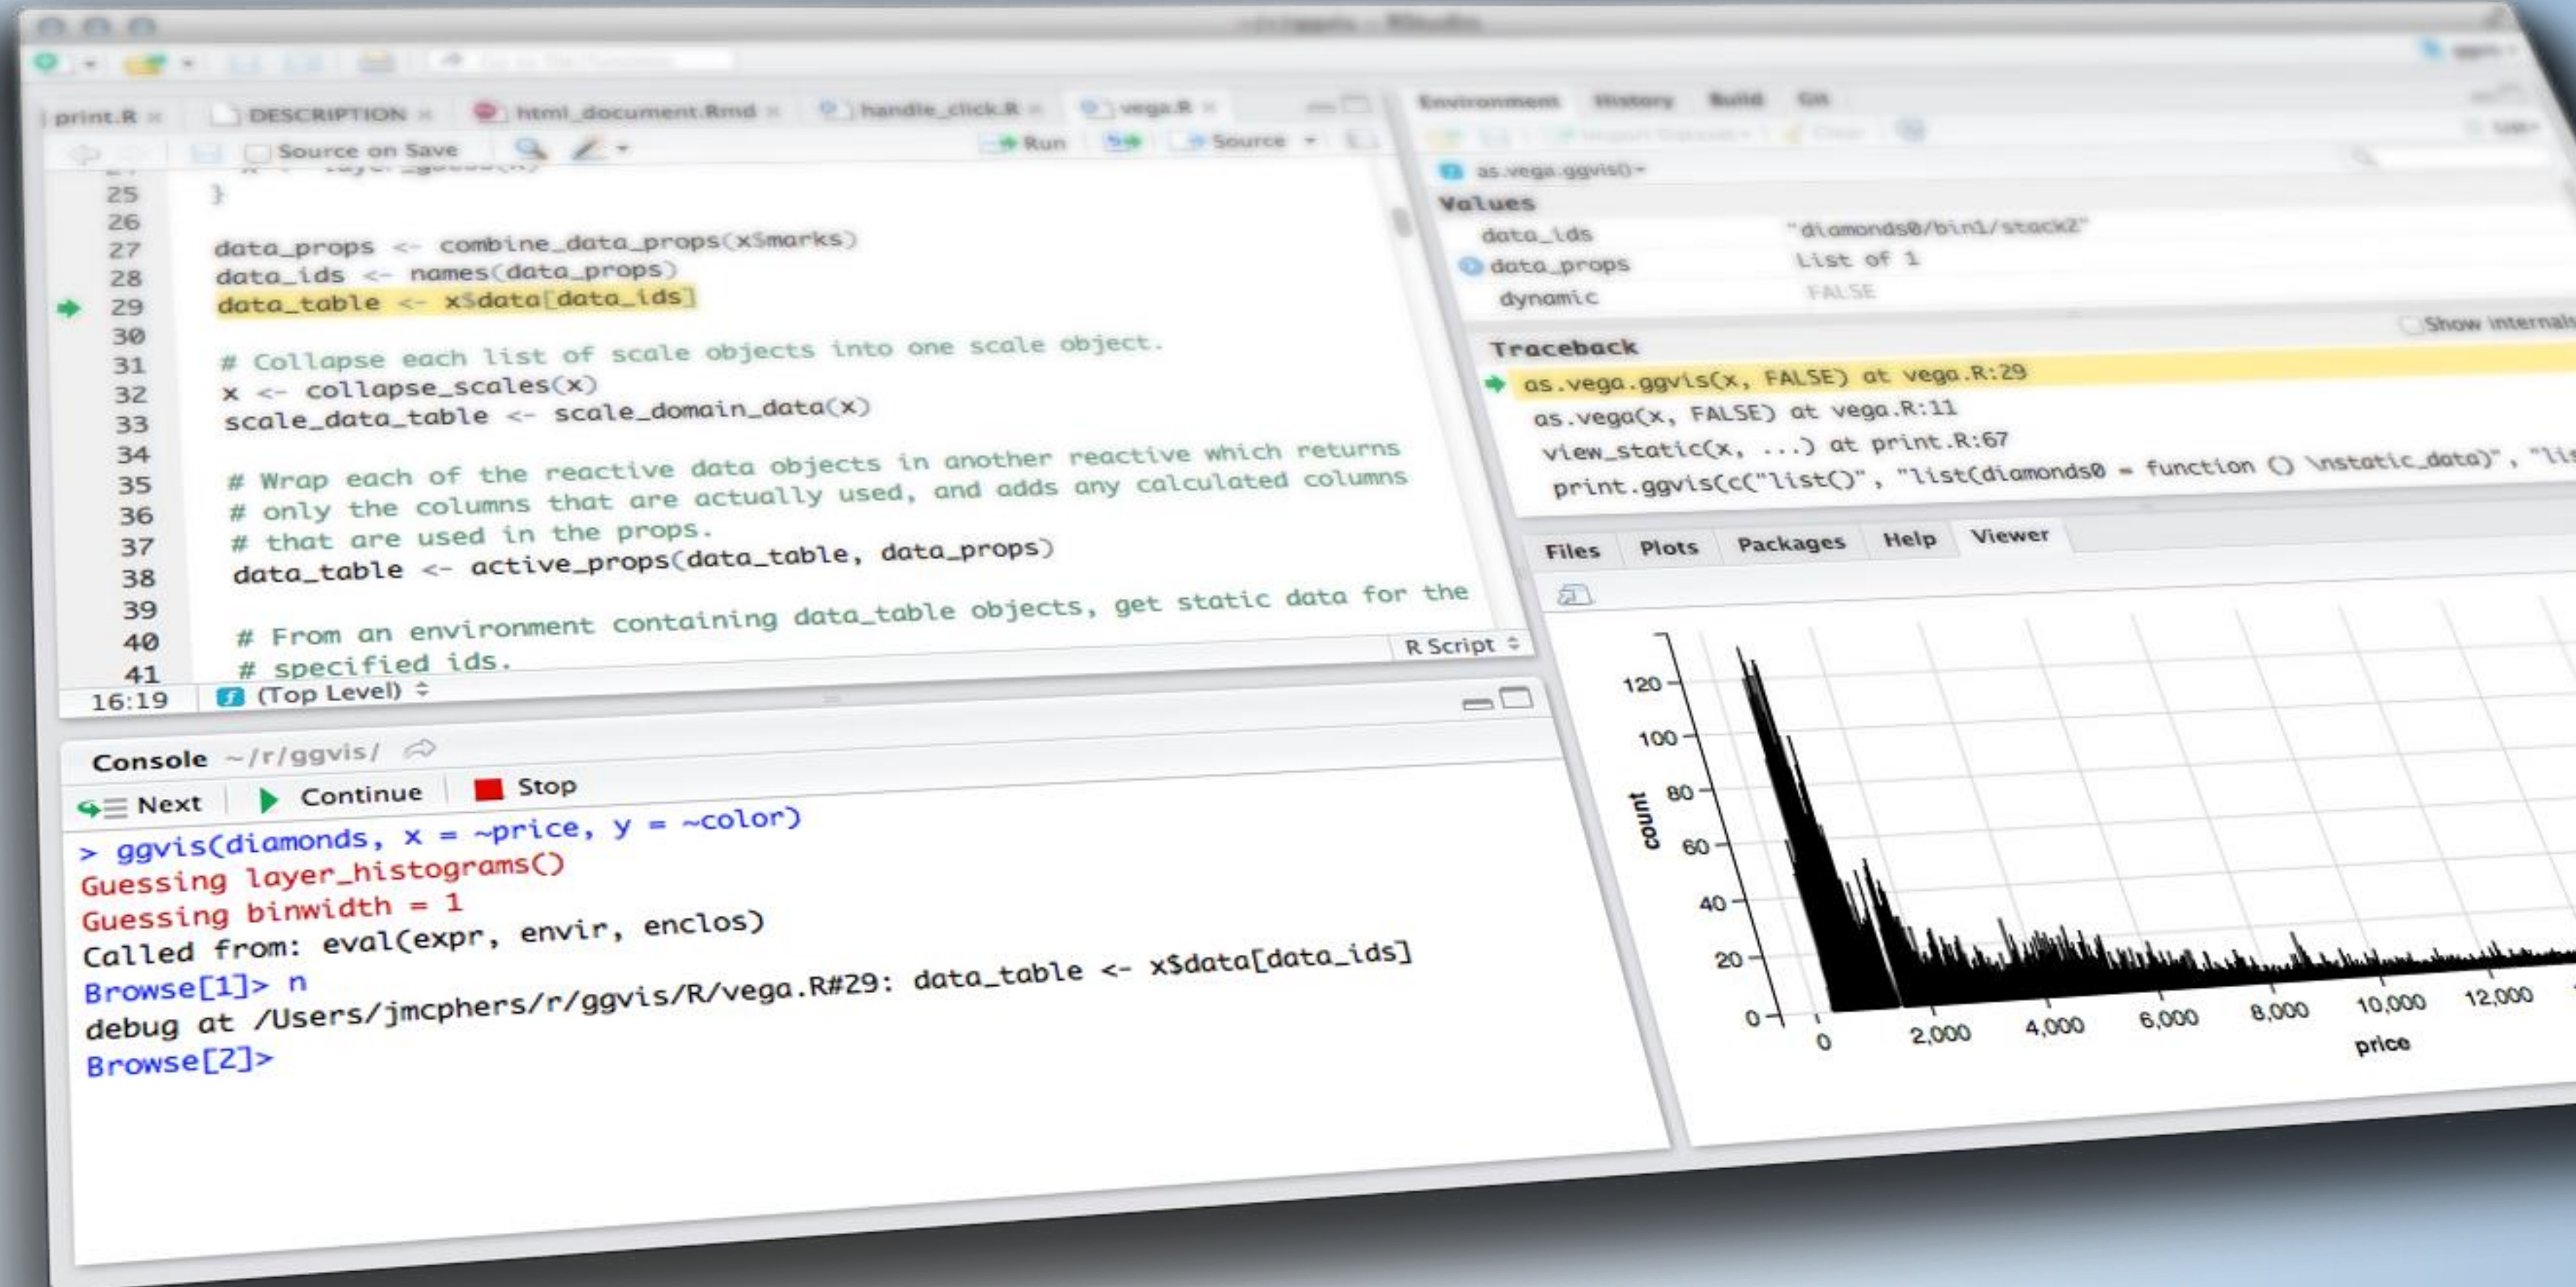

Using

Shiny UI Editor

Shiny UI Live Demo

REACTIVE PROGRAMMING & UNDERSTANDING UI

EXERCISE

- ▶ Create the Repo for your homework assignment
 - ▶ Click “New” on the course [GitHub page](#)
 - ▶ Name the repository your hw1 + your Andrew ID
 - ▶ ie: hw1-gla
 - ▶ Click “Create repository”
 - ▶ Clone the repo to your computer
- ▶ In RStudio create a new project in an existing directory
 - ▶ Select the cloned repository
 - ▶ If you’ve already started your homework simply move all your work into this repository

3_m 00_s

EXERCISE

- ▶ Publishing a Shiny App
 - ▶ Sign up on <https://www.shinyapps.io/>
 - ▶ Go to the tokens page
 - ▶ Copy your tokens with secret to clip board
 - ▶ In Rstudio in any of the movies apps, go to the publish button 
 - ▶ Follow the steps to add your shiny apps io token.
 - ▶ Publish the app
